INTRODUCTION

1.1 Project Overview

AI technologies can play an important role in breaking down the communication barriers of deaf or hearing-impaired people with other communities, contributing significantly to their social inclusion. Recent advances in both sensing technologies and AI algorithms have paved the way for the development of various applications aiming at fulfilling the needs of deaf and hearing-impaired communities. To this end, this survey aims to provide a comprehensive review of state-of-the-art methods in sign language capturing, recognition, translation and representation, pinpointing their advantages and limitations. In addition, the survey presents many applications, while it discusses the main challenges in sign language technologies. Future research direction are also proposed in order to assist prospective researchers towards further advancing the field. Sign languages are the primary language of many people worldwide. To overcome communication barriers between the Deaf and the hearing community, artificial intelligence technologies have been employed, aiming to develop systems for automated sign language recognition and generation have to be considered - though sharing some characteristics of spoken languages -since they differ in others.

1.2 Purpose

The main purpose is communication between hearing-impaired people and other communities and also the Sign language recognition, sign language representation, sign language capturing. We are using a convolution neural network to create a model that is trained on different hand gestures. An app is built which uses this model. This app enables deaf and dumb people to convey their information using signs which get converted to human-understandable language and speech is given as output. The main purpose is communication between hearing-impaired people and other communities and also the Sign language recognition, sign language representation, sign language capturing. We are using a convolution neural network to create a model that is trained on different hand gestures. A basic understanding of the particularities and notation of sign language serves to understand the importance better and challenges of automated sign language translation. An app is built which uses this model. This app enables deaf and dumb people to convey their information using signs which get converted to human-understandable language and speech is given as output.

LITERATURE SURVEY

2.1 Existing Problem

The aforementioned search condition describes the existence of the above words (i.e., recognition, translation, etc.) in the title, abstract or keywords of the literature works. In this context, allows for variations in the search terms i.e., capture allows the existence of words, such as capture, capturing, etc. In addition, the search is performed for papers published after 2018 since the field is evolving with fast pace and older methods are rendered quickly obsolete. To this end, this review aims to present only the latest and best works related to sign language technologies. Communication is the only medium by which we can share our thoughts or convey the message but for a person with disability (deaf and dumb) faces difficulty in communication with normal person. Because of this, a person who lacks in hearing and speaking ability is not able to stand in race with normal person.

Deafness is either congenital or acquired. Congenital deafness arises from some natural cause which deprives the child of hearing from its birth. Acquired deafness arises from disease, accident, or other causes. Older people who can't hear well may become depressed, or they may withdraw from others because they feel frustrated or embarrassed about not understanding what is being said. Sometimes, older people are mistakenly thought to be confused, unresponsive, or uncooperative because they don't hear well. Hearing people

and their constant, pervasive audism. Hearing people and their incessant creation of barriers to Deaf people's equality, employment, language, culture, and freedom to be themselves in the way they want to be. Deaf individuals face oral and printed language barriers. Deaf individuals have limited access to health-care services due to communication barriers and interpersonal factors. You can imagine the emotional and psychological toll of not being able to communicate with those closest to you, let alone others at school or work. For many deaf individuals living in rural areas, they might be the only deaf person in their community or school, making it extremely challenging to build relationships.

2.2 Reference

The papers included in this review have been published as journal articles, conference proceedings and book chapters (i.e., DOCTYPE) in the fields of computing and engineering (i.e., SUBJAREA). A systematic literature search was performed by adopting the PRISMA guidelines. The articles were extracted in June 2021 from three academic databases, namely Scopus.

2.3 Problem Statement Definition

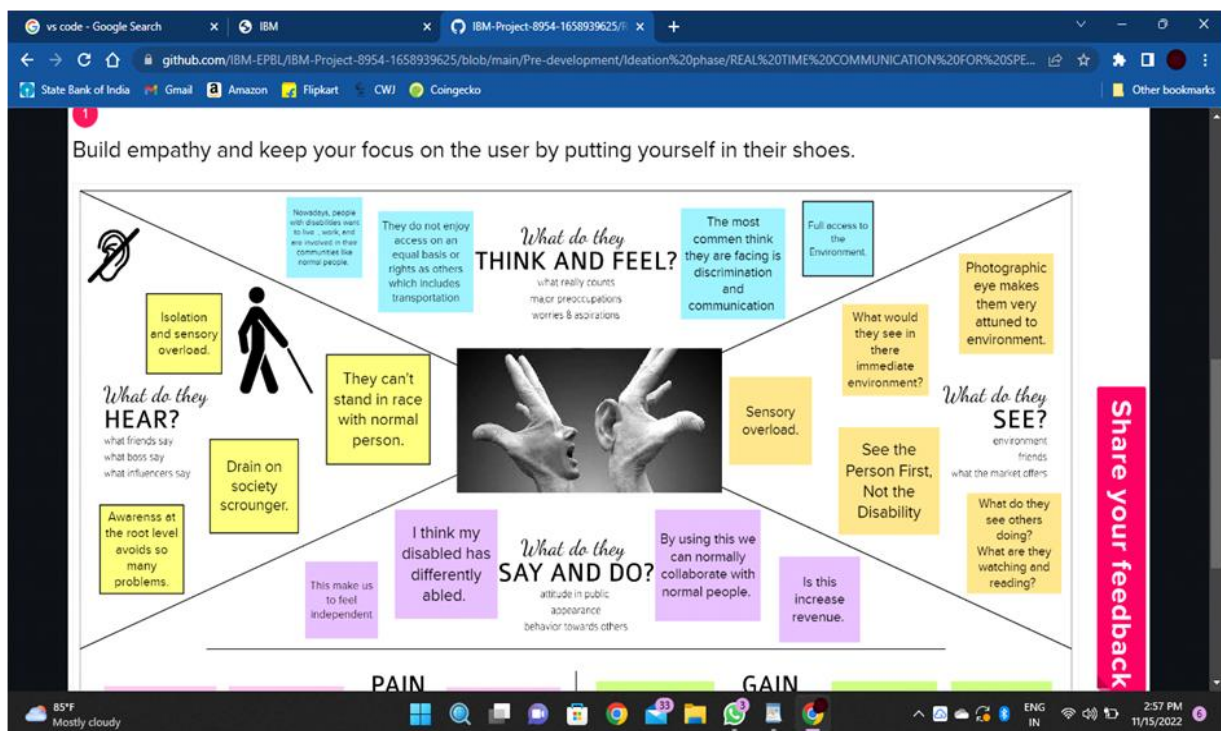

Communication is the only medium by which we can share our thoughts or convey the message but for a person

with disability (deaf and dumb) faces difficulty in communication with normal person. Because of this, a person who lacks in hearing and speaking ability is not able to stand in race with normal person. The number of the records retrieved from the three databases is 2368. From this number, 331 duplicate records are removed, leading to 2037 unique records. After screening title, abstract and finally the full text with various criteria to discard irrelevant records, 106 records remain and are included in this review. Sign languages are natural languages that use different means of expression for communication in everyday life. More particularly, it is the only means of communication for the hearing impaired. Thus, it provides replacement for speech among deaf and mute people. Several research works are going on sign language in order to make the communication between a deaf person and a normal person easy. Japanese Sign Language etc. Generally, the semantic meanings of the language components in all these sign languages differ, but there are signs with a universal syntax. For example, a simple gesture with one hand expressing 'hi' or 'goodbye' has the same meaning all over the world and in all forms of sign languages. Sign languages are natural languages that use different means of expression for communication in everyday life.

IDEATION & PROPOSED SOLUTION

3.1 Empathy Map Canvas

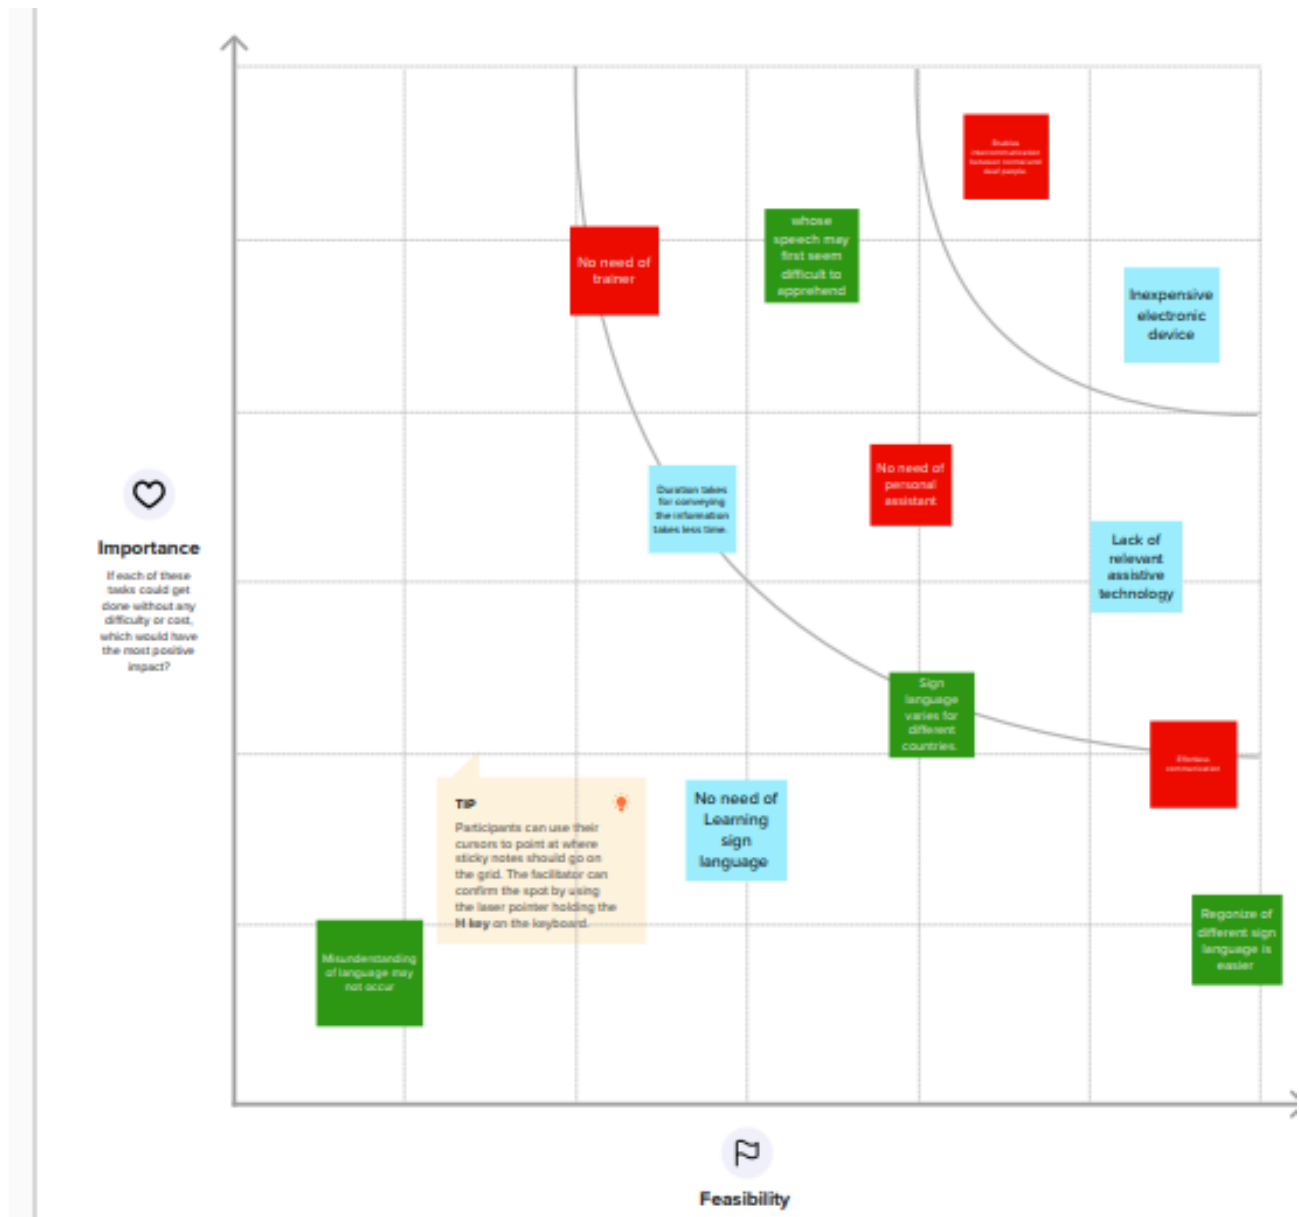

- An empathy map is a simple, easy-to-digest visual that captures knowledge about a user's behaviors and attitudes.
- It is a useful tool to help teams better understand their users. Creating an effective solution requires understanding the true problem and the person who is experiencing it.
- The exercise of creating the map helps participants consider things from the user's perspective along with his or her goals and challenges.

3.2 Ideation & Brainstorming

Step 1:

Team Gathering, Collaboration and Select the Problem Statement

3.3 Proposed Solution

Project Design Phase-I
Proposed Solution Template

Date	30 September 2022
Team ID	PNT2022TMID29700
Project Name	Real-Time Communication System Powered by AI for Specially Abled
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	➤ The deaf and dumb people have difficulty in communicating with others who cannot

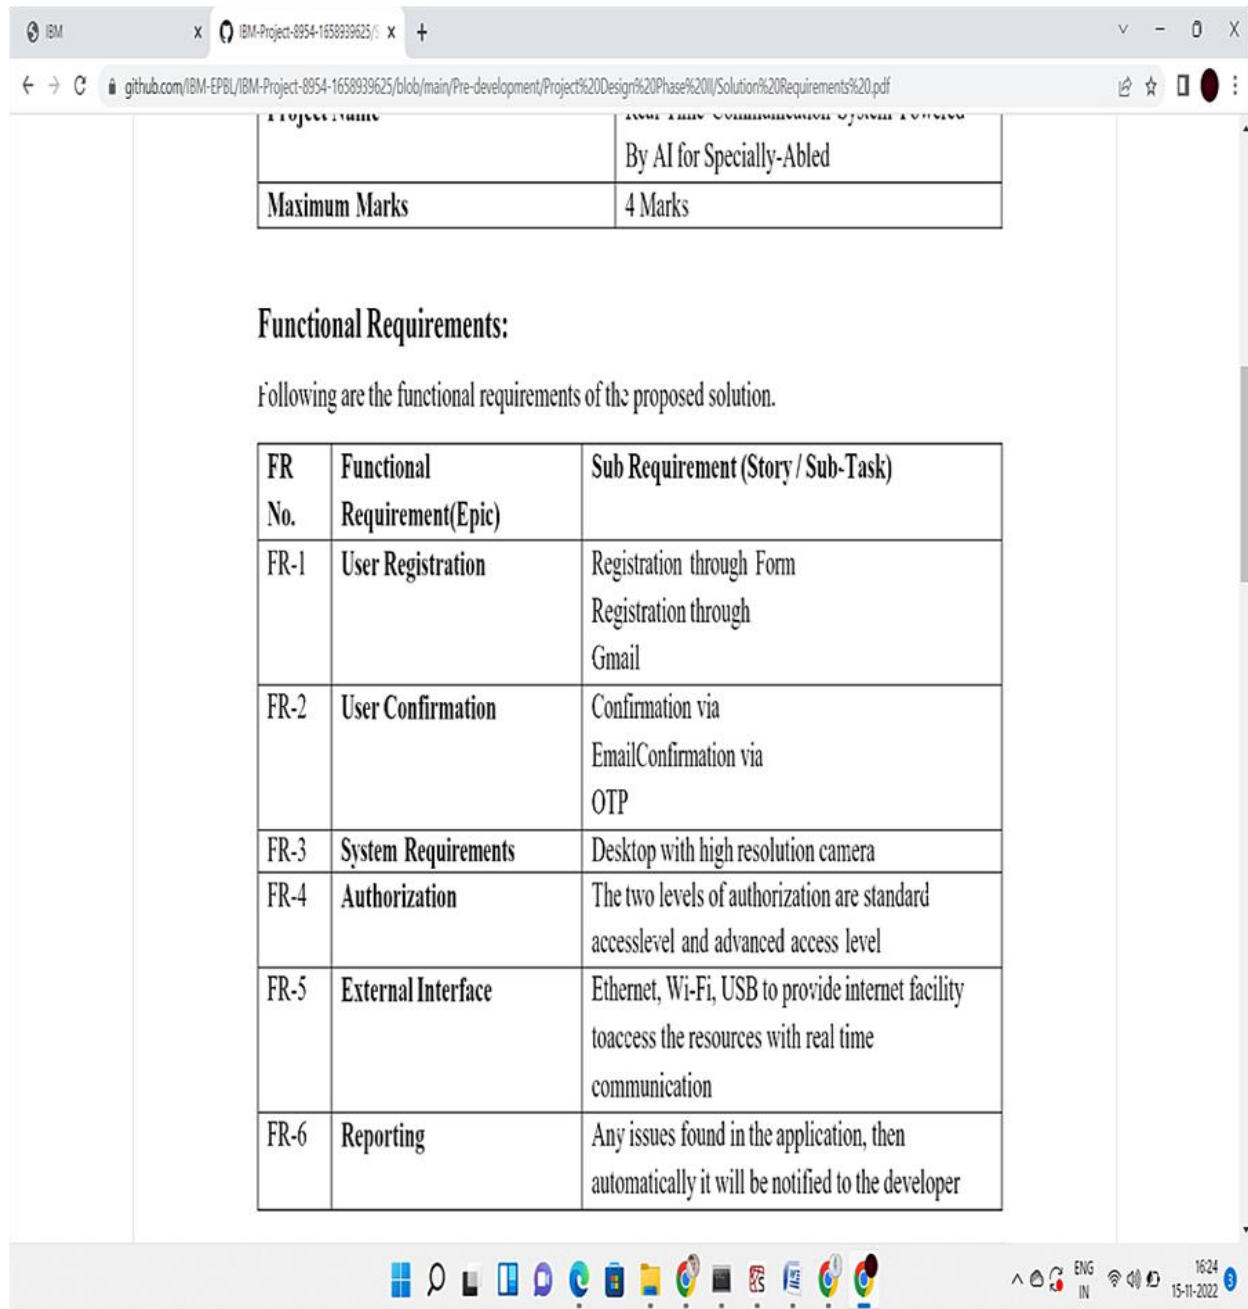

3.4 Problem Solution

Project Title: Project Design Phase-I Solution Fit Template Team ID: PN/2022TMID29730

Define CS, fit into CC	1. CUSTOMER SEGMENT(S) CS The person who is deaf and dumb Who need a proper communication between normal people.	6. CUSTOMER CONSTRAINTS CC Public announcements, Slow talkers, Sign language misunderstandings.	5. AVAILABLE SOLUTIONS AS Only solution is conveying there thoughts has i: through a proper co mmunication ii wil help them to overcome all dhe challenges.	Explore AS, differentiate
	2. JOBS-TO-BE-DONE / PROBLEMS J&P Language and communication, which, in t,m, profoundly affect most of there normal life.	9. PROBLEM ROOT CAUSE RC Language and guiding assistance unavailability are some root causes of there problem. The need to solve this root cause is to develop a proper communication	7. BEHAVIOUR BE Hearing loss among people has a profound effect on communication, social, and educational development. Compared with normal-hearing peers, person who are deaf and hard of hearing (DHH) are at higher risk of adverse social and emotional development, which ma, less to disruptive behavioral problems.	
Focus on J&P, tap into BE, understand RC		Focus on J&P, tap into BE, understand RC		

REQUIREMENT ANALYSIS

4.1 Functional Requirement

The screenshot shows a web browser window with the address bar displaying a GitHub repository URL. The page content includes a table with project details and a section for functional requirements.

Project Name	By AI for Specially-Abled
Maximum Marks	4 Marks

Functional Requirements:

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement(Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Registration	Registration through Form Registration through Gmail
FR-2	User Confirmation	Confirmation via Email Confirmation via OTP
FR-3	System Requirements	Desktop with high resolution camera
FR-4	Authorization	The two levels of authorization are standard access level and advanced access level
FR-5	External Interface	Ethernet, Wi-Fi, USB to provide internet facility to access the resources with real time communication
FR-6	Reporting	Any issues found in the application, then automatically it will be notified to the developer

4.2 Non Functional Requirement

IBM x IBM-Project-8954-1658939625 x +

github.com/IBM-EPBL/IBM-Project-8954-1658939625/blob/main/Pre-development/Project%20Design%20Phase%20II/Solution%20Requirements%20.pdf

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	To communicate a message to the normal people and to translate speech into sign language that the deaf and the dumb may understand.
NFR-2	Security	Only users have access to material that has been translated from signs into voice.
NFR-3	Reliability	Provides information about possible problems with desktop apps on controlled devices.

Windows taskbar: 16:24 15-11-2022

PROJECT DESIGN

5.1 Data Flow Diagrams

Project Design Phase-II
Data Flow Diagram & User Stories

Date	04 October 2022
Team ID	PNT2022TMID29700
Project Name	Project – Real Time Communication System Powered by AI for Specially Abled
Maximum Marks	4 Marks

Data Flow Diagrams:

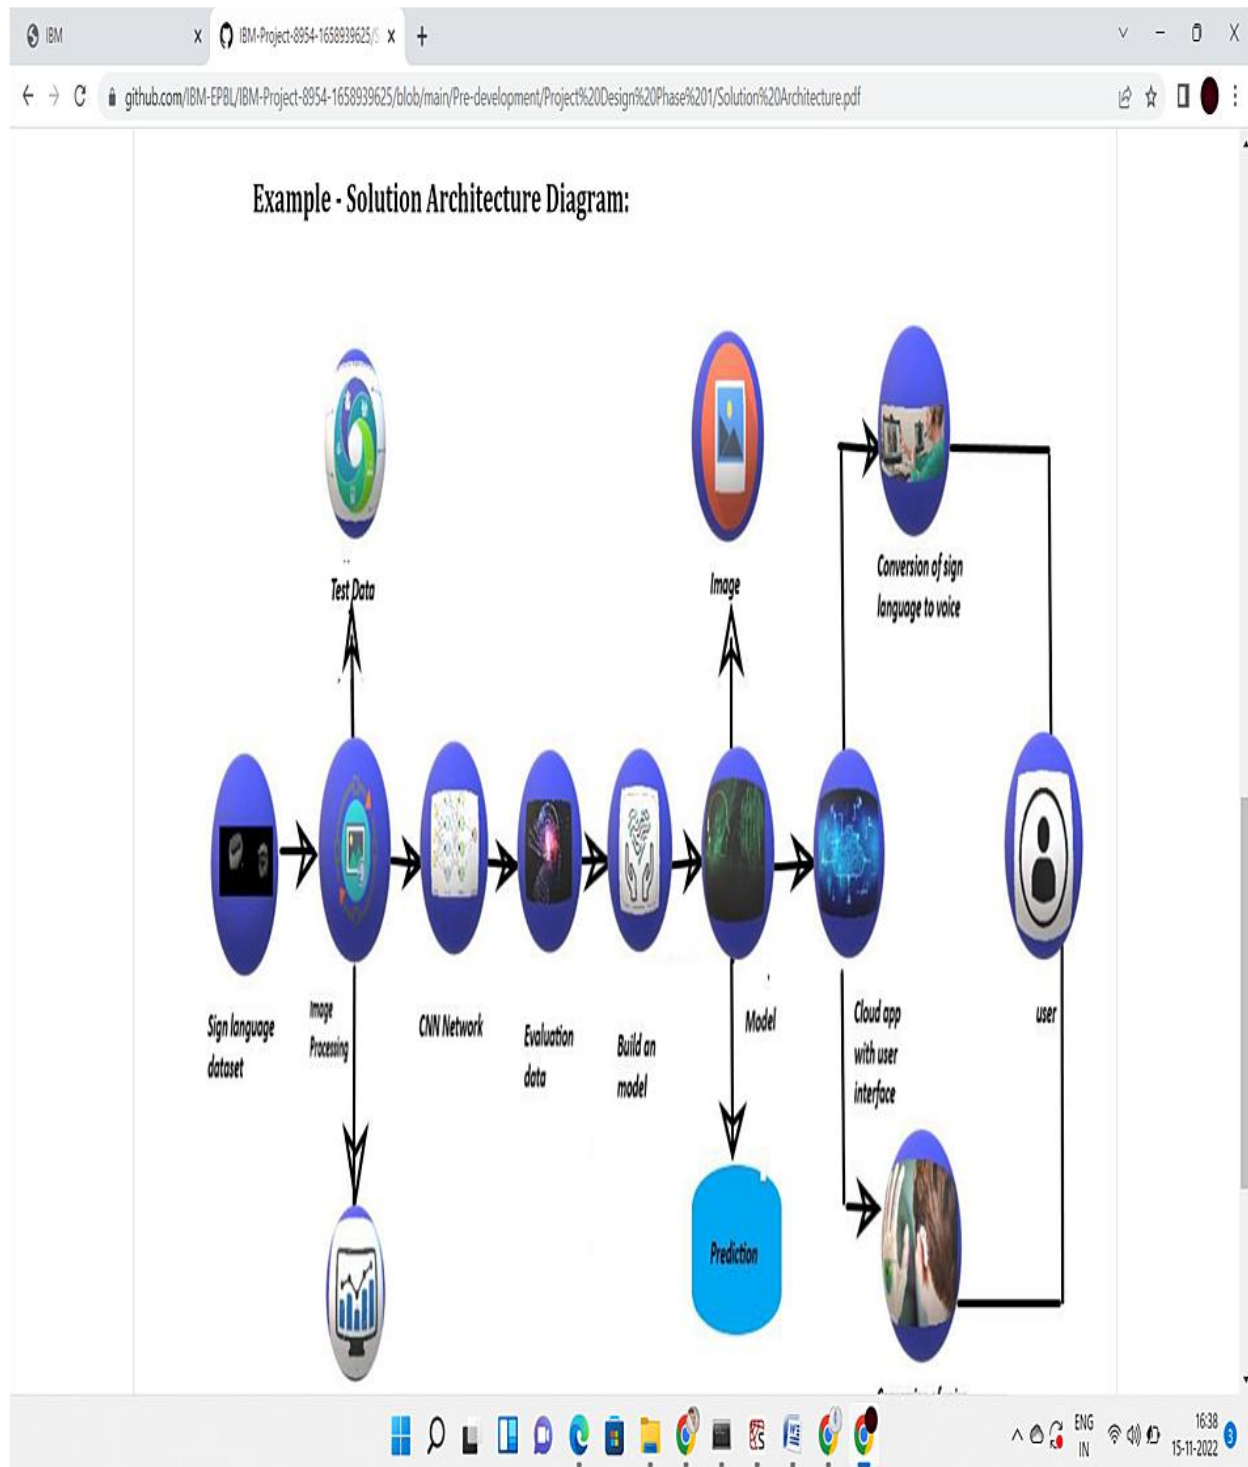

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD can depict the right amount of the system requirement graphically. It shows how data enters and leaves the system, what changes the information.

Data Flow Diagram:

```
graph TD
    UserLogin[User login] --> UserApp[User Application]
    UserApp --> VoiceResponse[Voice response]
    UserApp --> SignLanguage[Sign language image]
    VoiceResponse --> SignLanguage
    SignLanguage --> ImageProc[Image Processing]
    ImageProc --> TrainTest[Train and Test]
    TrainTest --> CNN[CNN network]
    CNN --> Model[Model]
    Model --> Data[Data]
    Data --> Model
    Model --> UserApp
    Database[Database] --> ImageProc
    ImageProc --> OutputData[Output data]
```

The diagram illustrates the data flow within a Real Time Communication System. It starts with a 'User login' process leading to a 'User Application'. The 'User Application' interacts with 'Voice response' and 'Sign language image' processes. 'Voice response' feeds into 'Sign language image', which then feeds into 'Image Processing'. 'Image Processing' leads to 'Train and Test', which feeds into a 'CNN network'. The 'CNN network' feeds into a 'Model', which interacts with 'Data' and feeds back into the 'User Application'. A 'Database' also feeds into 'Image Processing', which produces 'Output data'.

5.2 Solution Architecture

5.3 User Stories

IBM x IBM-Project-8954-1658939625 x +

PROJECT PLANNING AND SCHEDULING

6.1 Sprint Planning & Estimation

The screenshot shows a web browser displaying a PDF document from a GitHub repository. The document contains the following information:

Field	Value
Date	18 October 2022
Team ID	PNT2022TMID29700
Project Name	Real-Time Communication System Powered by AI for Specially Abled
Maximum Marks	8 Marks

Product Backlog, Sprint Schedule, and Estimation (4 Marks)

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Members
Sprint-1	Dataset Collection	USN-1	Collect Dataset for building model.	5	High	Priyanga swetha yaminsehwag
Sprint-1	Image Preprocessing	USN-2	Perform pre-processing techniques on the dataset.	3	Medium	Srinath Scrumathi
Sprint-2	Model Building	USN-3	Import the required libraries, add the necessary layers and compile the model.	5	High	Priyanga Srinath Swetha
Sprint-2		USN-4	Training the image classification model using CNN.	3	Medium	Sarumathi Yamin Sehwag
Sprint-3	Training and Testing the Model	USN-5	Training the model and testing the model's performance.	8	High	Priyanga Srinath

6.2 Sprint Delivery Schedule

Project Tracker, Velocity & Burndown Chart: (4 Marks)

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed (as on Planned End Date)	Sprint Release Date (Actual)
Sprint-1	8	6 Days	24 Oct 2022	24 Oct 2022	8	25 Oct 2022
Sprint-2	8	6 Days	31 Oct 2022	07 Nov 2022	8	05 Nov 2022
Sprint-3	8	6 Days	07 Nov 2022	12 Nov 2022	8	12 Nov 2022
Sprint-4	8	6 Days	14 Nov 2022	19 Nov 2022	8	19 Nov 2022

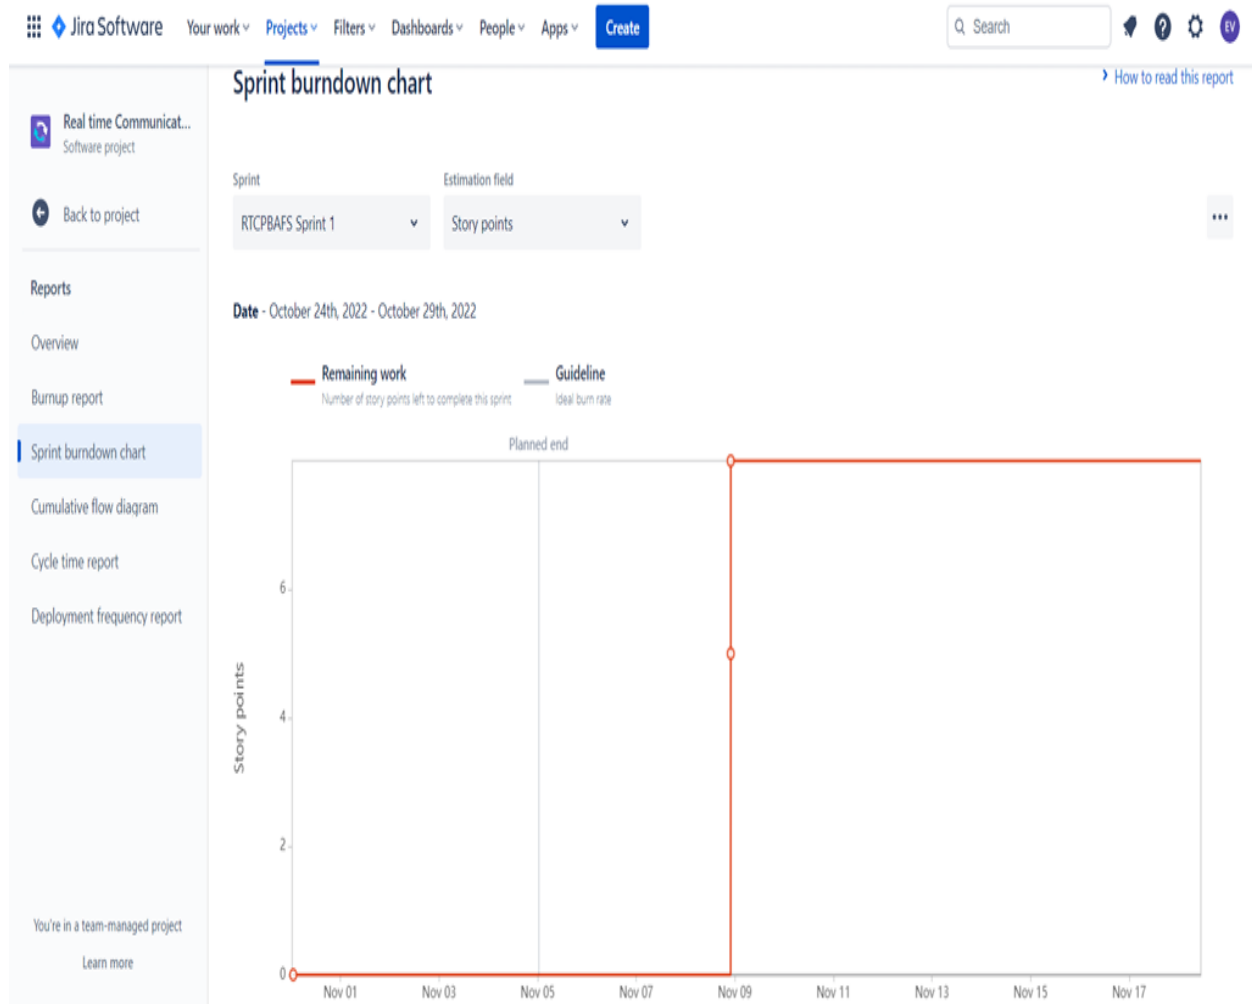

Velocity:

$$AV = \frac{\text{sprint duration}}{\text{velocity}}$$

<h3>Signlanguage Classification: </h3>

<br>

<p>Sign languages (also known as signed languages) are languages that use the visual-manual modal  
words. Sign languages are expressed through manual articulation in combination with non-manual markers. Sign  
with their own grammar and lexicon.[1] Sign languages are not universal and are usually not mutually intelligible  
among different sign languages.

Linguists consider both spoken and signed communication to be types of natural language, meaning  
protracted aging process and evolved over time without meticulous planning.[3] Sign language should not be con  
nonverbal communication.

Wherever communities of deaf people exist, sign languages have developed as useful means of communica  
cultures. Although signing is used primarily by the deaf and hard of hearing, it is also used by hearing individuals  
those who have trouble with oral language due to a disability or condition (augmentative and alternative communica  
including children of deaf adults.</p>

	Confidence Score (Only Yolo Projects)	Class  Detected -  N/A  Confidence  Score- N/A	N/A

## ADVANTAGES

- Gives people who have more hearing impairment more confidence.
- The proposed model here produces enormous accuracy of classification.

- Images of enormous can be resized within the d itself.
- Vast datasets can also be trained and tested.
- Enables Children to Communicate Effectively.
- Decreases Frustration.
- Improves Child-Parent Communication.
- Helps Children Remember Words.
- Increases Self Esteem.
- Provides An Insight Into Your Child's World.
- Sign language Is for Everyone.
- Builds Relationships.

## **DISADVANTAGES**

- Finger spelling, which is a representation of the letters of the written alphabet using only your hands.
- Sign supported speech, which combines spoken and sign language and is used as a basis for learning the grammatical structure of spoken language.

- Cued speech, which facilitates speech reading.

## **CONCLUSION**

The broad spectrum of AI technologies provide a result of sign language is covered. Starting from sign language capturing methods for the collection of sign language data and moving on to sign language recognition and representation techniques for the identification and translation of sign language, this review highlights all important technologies for the construction of a complete AI-based sign language system. Additionally, it explores the in-between relations among the AI technologies and presents their advantages and challenges. Finally, it presents groundbreaking sign language applications that facilitate the communication between hearing-impaired and speaking people, as well as enable the social inclusion of hearing-impaired people in their everyday life. The aim of this review is to familiarize researchers with sign language technologies and assist them towards developing better approaches.

Several devices have been used to acquire sign data, such as Data glove, Kinect, Leap motion controller and Camera in acquiring data. Despite the fact that these devices have contributed to the performance and

accuracy of the ASLR system. These devices have some shortcomings, such as high cost and inconvenience to use associated with dataglove. The image acquired from a low-resolution camera also affects the recognition accuracy of the system. Therefore, there is a need for more research that fuses images from multiple devices such as a camera, dataglove, and Kinect to acquired images to produce better results without feature extraction. Skin colour segmentation and edge detection techniques have demonstrated robust improved segmentation performance. Hybridization of two or more feature extraction techniques has also been shown to produce more robust recognition features.
